Table of Contents

<i>R_s</i> - <i>K</i> estimation template manual	1
1. Overview of worksheet “ <i>R_s</i> - <i>K</i> model”	3
2. Overview of procedure	4
2.1. Enter input data	4
2.2. Specify initial guess of <i>R_s</i> and <i>K</i>	5
2.3. Run Solver	5
2.4. Inspect the plots for each data set	8
2.5. Inspect the numerical results	9
3. Appendix: Load Solver Addin	12

1. Overview of worksheet "Rs-K model"

Structure of the worksheet is as follows.

- Top: Plots with results of nonlinear and linear least squares analysis
- Middle: Results of nonlinear and linear least squares analysis
- Bottom: input data

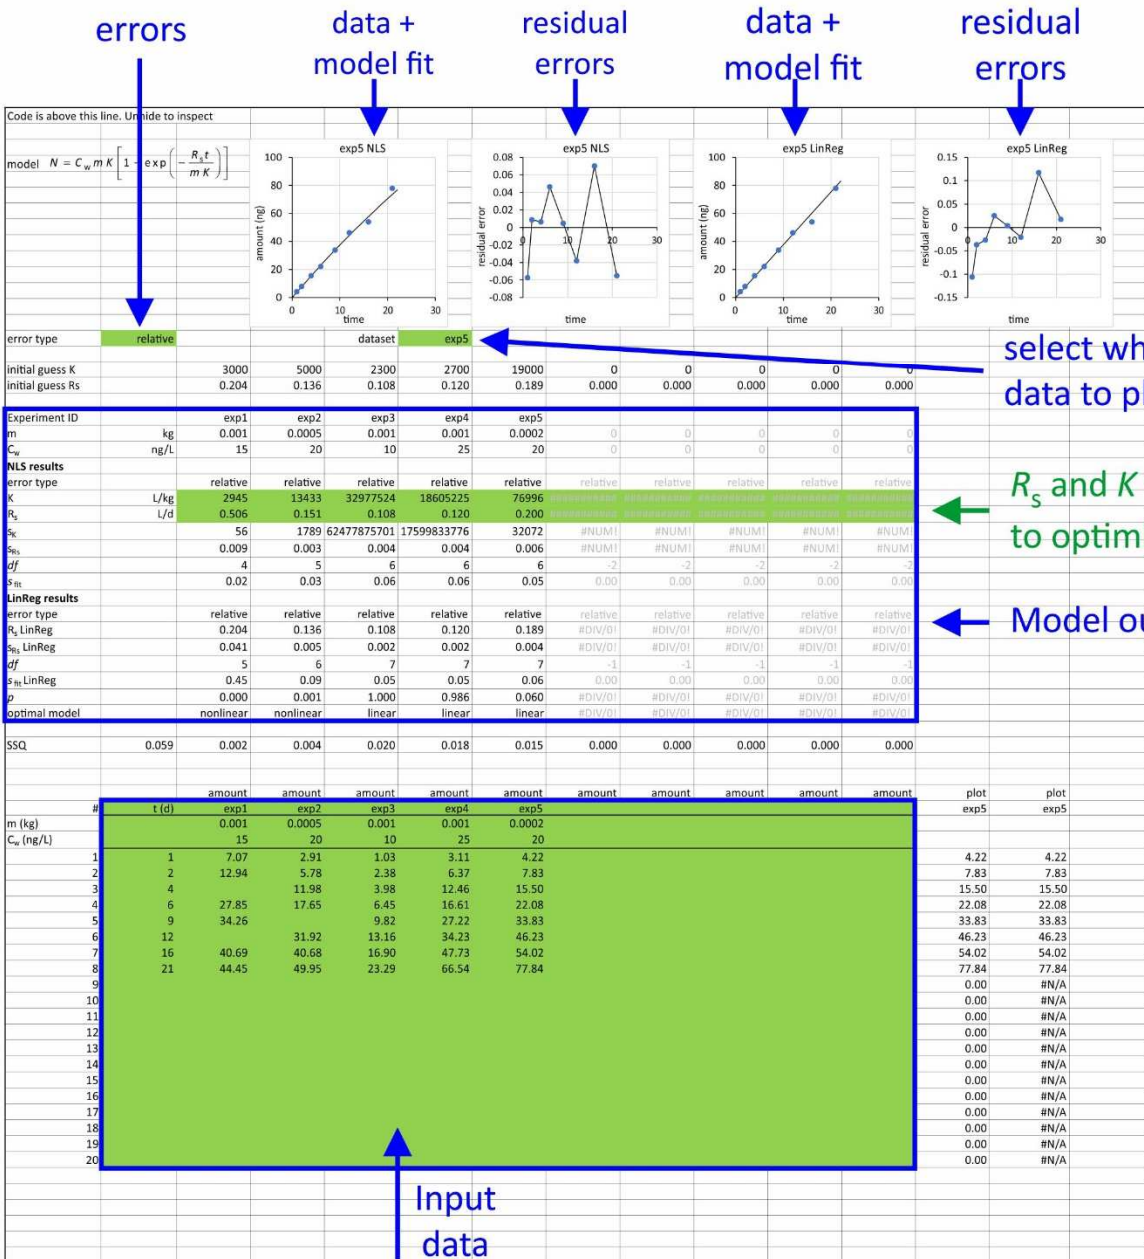

Green cells can be safely changed. Do not change the other cells.

Code is hidden at the top for convenience. Unhide rows if you want to see it.

Choose to minimize
absolute or relative
errors

Plots Nonlinear

to optimize

Model output

Input
data

2. Overview of procedure

1. Enter input data (type or paste as values)
2. Specify initial guess of R_s and K
3. Run Solver
4. Inspect the plots for each data set
5. Inspect the numerical results

2.1. Enter input data

Two ways to go:

1. type data directly in the Input data block
2. prepare a data block separately and paste as follows:

Experiment IDs
10 columns or less

t (d)	exp1	exp2	exp3	exp4	exp5
	0.001	0.0005	0.001	0.001	0.0002
	15	20	10	25	20
1	7.07	2.91	1.03	3.11	4.22
2	12.94	5.78	2.38	6.37	7.83
4		11.98	3.98	12.46	15.50
6	27.85	17.65	6.45	16.61	22.08
9	34.26		9.82	27.22	33.83
12		31.92	13.16	34.23	46.23
16	40.69	40.68	16.90	47.73	54.02
21	44.45	49.95	23.29	66.54	77.84

← Sorbent mass in kg
← C_w in ng/L

Time in d
20 lines or less
Copy data

Amounts in ng
missing data is OK

t (d)	exp1	exp2	exp3	exp4	exp5
	0.001	0.0005	0.001	0.001	0.0002
	15	20	10	25	20
1	7.07	2.91	1.03	3.11	4.22
2	12.94	5.78	2.38	6.37	7.83
4		11.98	3.98	12.46	15.50
6	27.85	17.65	6.45	16.61	22.08
9	34.26		9.82	27.22	33.83
12		31.92	13.16	34.23	46.23
16	40.69	40.68	16.90	47.73	54.02
21	44.45	49.95	23.29	66.54	77.84

Paste as values

The screenshot shows an Excel worksheet with a 'Paste Special' dialog box open. The dialog box has the following options:

- Paste:**
 - All
 - Formulas
 - Values
 - Formats
 - Comments
 - Validation
 - All using Source theme
 - All except borders
 - Column widths
 - Formulas and number formats
 - Values and number formats
 - All merging conditional formats
- Operation:**
 - None
 - Add
 - Subtract
 - Multiply
 - Divide
- Skip blanks
- Transpose

Buttons: Paste Link, OK, Cancel

Never use cut and paste, as this invalidates cell references in the worksheet.

2.2. Specify initial guess of R_s and K

NLS parameter estimation need an initial guess of the values. Initial values are not too critical, but extremely high values and zeros should be avoided.

Just below the plots are two rows with fair guesses.

Two ways to go:

1. Copy the suggested guesses and past as values in the K and R_s row below that.
2. Type initial values directly into the K and R_s rows

initial guess K		3000	5000	2300	2700	19000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
initial guess R_s		0.204	0.136	0.108	0.120	0.189	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	
Experiment ID		exp1	exp2	exp3	exp4	exp5															
m	kg	0.001	0.0005	0.001	0.001	0.0002	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
C_w	ng/L	15	20	10	25	20	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
NLS results																					
error type		relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative	relative
K	L/kg	2945	13433	32977524	18605225	76996															
R_s	L/c	0.506	0.151	0.108	0.120	0.200															
S_C		56	1789	62477875701	17599833776	32072	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!
S_{SC}		0.009	0.003	0.004	0.004	0.006	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!	#NUM!
df		4	5	6	6	6	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2	-2
S_{fit}		0.02	0.03	0.06	0.06	0.05	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

2.3. Run Solver

Check if Solver is activated (far right on the Data tab)

If Solver is not loaded then load it (once and forever)

1. go to section 4 Appendix: Load Solver
2. or go to <https://support.office.com/en-us/article/load-the-solver-add-in-in-excel-612926fc-d53b-46b4-872c-e24772f078ca>
3. or watch <https://www.youtube.com/watch?v=W6tIS4JZ5J0>

Click Solver (far right on the Data tab)

Check:

- Objective : SumSSQ
- To : Min
- By Changing Variable Cells : Rs_K_values

SumSSQ
minimize
by changing
Rs and K

Solver Parameters

Set Objective: SumSSQ

To: Max Min Value Of: 0

By Changing Variable Cells: Rs_K_values

Subject to the Constraints:

Make Unconstrained Variables Non-Negative

Select a Solving Method: GRG Nonlinear

Solving Method
Select the GRG Nonlinear engine for Solver Problems that are smooth nonlinear. Select the LP Simplex engine for linear Solver Problems, and select the Evolutionary engine for Solver problems that are non-smooth.

Help Solve Close

Click Solve

Most of the time Solver says that it has only converged. That is not good enough.
Converged.

Good, but not good enough

Solver Results

Solver has converged to the current solution. All Constraints are satisfied.

Keep Solver Solution Restore Original Values

Return to Solver Parameters Dialog

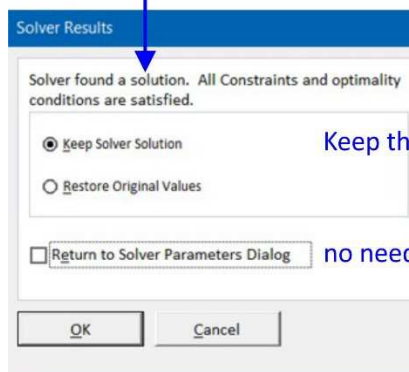

OK Cancel

Keep this guess

and return to Solver dialog

Return to the Solver dialog and click Solve again, (2-4 times) until Solver says that it has “found a solution”

Found a solution
is good enough

Keep the solution

no need to return to Solver dialog

2.4. Inspect the plots for each data set

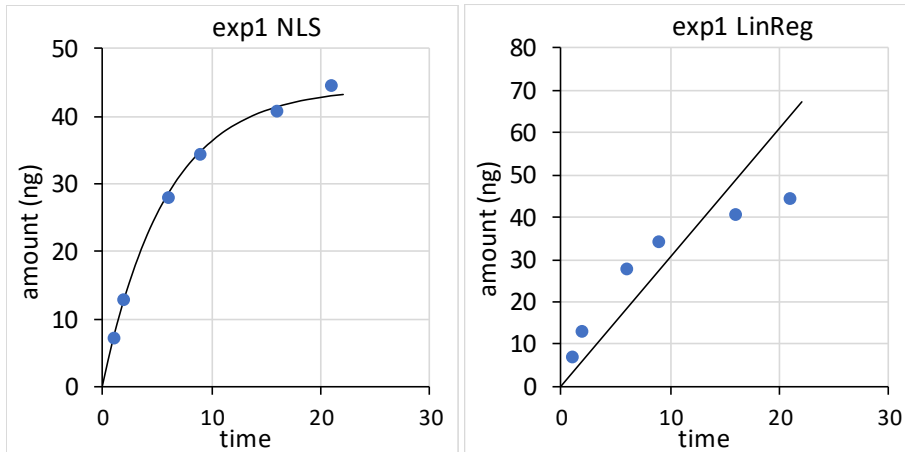

Select the data ID from the green drop-down list just below the plots.

Unit for the vertical axes of the residual error plots depends on the chosen error type:

- ng if absolute errors are minimized: modeled - measured.
- relative difference if relative errors are minimized: (modeled - measured)/measured.

The nonlinear model always gives a better fit of the data (1 more adjustable parameter), but not always significantly so (see section 2.5).

Test data exp1: nonlinear model is clearly better

Test data exp3: linear and nonlinear model fit the data equally well.

Test data exp5: Nonlinear model seems to fit the data slightly better, but maybe not significantly so.

2.5. Inspect the numerical results

Meaning of the entries in this table are as follows:

NLS results	
error type	absolute or relative errors, as chosen
K	estimated K
R_s	estimated R_s
S_K	estimated standard error of K
S_{R_s}	estimated standard error of R_s
df	degrees of freedom (number of data points minus 2)
s_{fit}	standard deviation of residual errors. In ng if absolute errors are minimized Given as a fraction if relative errors are minimized
LinReg results	
error type	absolute or relative errors, as chosen
R_s LinReg	estimated R_s
S_{R_s} LinReg	estimated standard error of R_s
df	degrees of freedom (number of data points minus 1)
s_{fit} LinReg	standard deviation of residual errors. In ng if absolute errors are minimized Given as a fraction if relative errors are minimized
p	Probability that the nonlinear model gives a better fit by chance. Value is based on partial F -test; https://www.youtube.com/watch?v=G_obrpV70QQ . See examples on next page.
optimal model	nonlinear if $p < 0.05$; linear if $p \geq 0.05$

See examples on next page.

Some examples based on test data (xlsx file, worksheet "test data")

	exp1	exp3	exp5
NLS results			
error type	relative	relative	relative
K	2945	7.8E07	76997
R_s	0.506	0.108	0.200
S_K	56	3.5E11	32073
S_{R_s}	0.009	0.004	0.006
df	4	6	6
S_{fit}	0.02	0.06	0.05
LinReg results			
error type	relative	relative	relative
R_s LinReg	0.204	0.108	0.189
S_{R_s} LinReg	0.041	0.002	0.004
df	5	7	7
S_{fit} LinReg	0.45	0.05	0.06
p	0.000	1.000	0.060
optimal model	nonlinear	linear	linear

exp1

Nonlinear model yields $K = 2945 \pm 56$ L/kg, $R_s = 0.506 \pm 0.009$, residual standard error = 0.02.

Performance of the linear model is worse: residual standard error = 0.45

Probability that the nonlinear model accidentally gives a better fit is < 0.001 .

Nonlinear model is selected.

exp3

Nonlinear model yields $K = 7.8 \cdot 10^7 \pm 3.5 \cdot 10^{11}$ L/kg, $R_s = 0.108 \pm 0.004$ L/d, residual standard error = 0.06.

Linear model describes the data equally well: $R_s = 0.108 \pm 0.002$ L/d, residual standard error = 0.05.

Probability that the nonlinear model accidentally gives a better fit is 1. There is no added value in using the nonlinear model. This is also evidenced by the huge standard error in K .

Linear model is selected

exp5

Nonlinear model yields $K = 77,000 \pm 32,000$ L/kg, $R_s = 0.200 \pm 0.006$ L/d, residual standard error = 0.05

Linear model describes the data equally well: $R_s = 0.189 \pm 0.004$ L/d, residual standard error = 0.06.

Probability that the nonlinear model accidentally gives a better fit is 0.06. This is higher than the 0.05 threshold.

There is not sufficient reason to assume that the nonlinear model gives a better fit.

Linear model is selected.

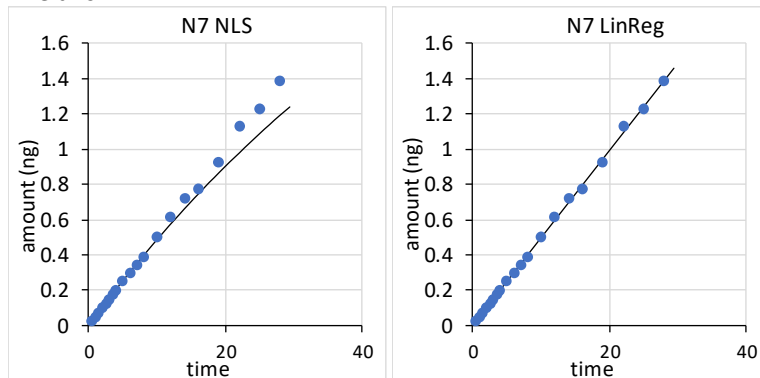

3. Known issues

Model lines not visible in the plots

Cause: initial values were set to zero. Use nonzero initial values (section 2.2)

Nonlinear model seems to give worse results than linear model.

Like this:

Cause: Optimization is not yet complete: Solver has only “converged to the current solution”. Run Solver again until “Solver has found a solution” (section 2.3).

Message “Objective cell contents must be a formula”

Cause: with the Solver dialog open, an empty cell was accidentally selected before clicking the Solve button. Check the “Set objective” reference in the solver dialog. Change this to “SumSSQ”.

Message “Solver has found a solution” but the model fits are very poor.

Cause: with the Solver dialog open, a non-empty cell was accidentally selected before clicking the Solve button. Check the “Set objective” reference in the solver dialog. Change this to “SumSSQ”.

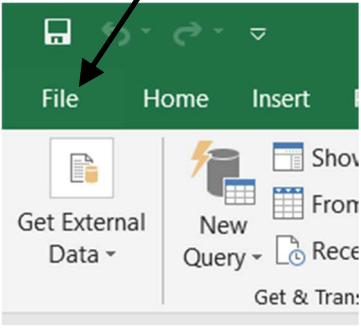

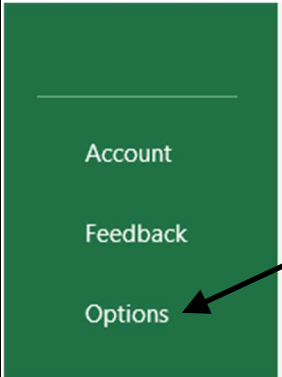

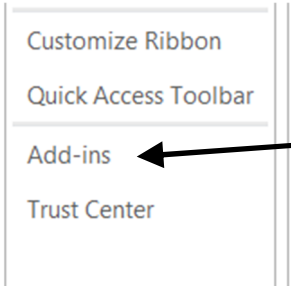

Message “Objective cell values do not converge”

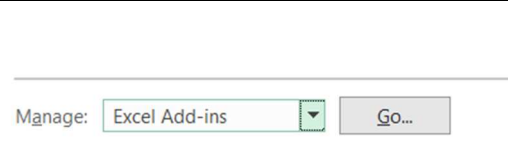

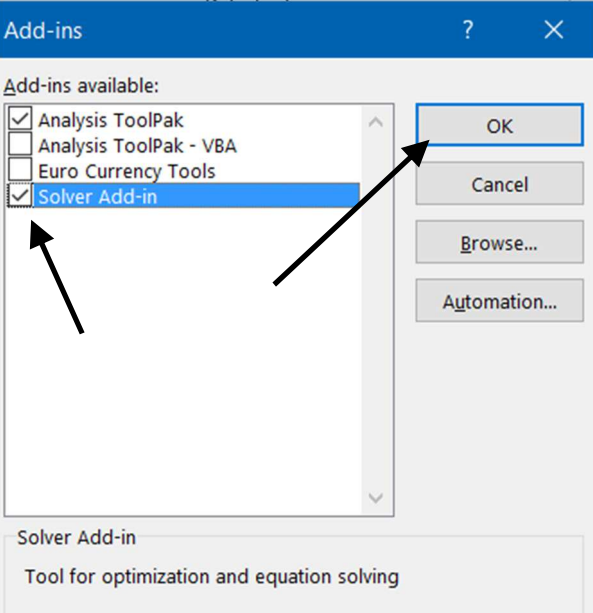

Cause: with the Solver dialog open, a non-empty cell was accidentally selected before clicking the Solve button. Check the “Set objective” reference in the solver dialog. Change this to “SumSSQ”.

Other unexpected results

Send an e-mail when you run into unexpected results (keesbooij@pasoc.eu). Attach a copy of the workbook.

4. Appendix: Load Solver Add-in

Step 1	Step 2	Step 3
Upper left corner: click File	Lower left corner: click Options	Click Add-ins
		

Step 4	Step 5
Bottom: select Excel Add-ins and Go	Check Solver Add-in and click OK
	

Done
